Spring Boot - Event Manager con validazioni

Obiettivo

Applicazione RESTful per gestione di eventi, partecipanti e location.

Struttura del progetto

AGGIUNGI DIPENDENZE IN pom.xml

Entità e Relazioni

Evento

• id: Long

nome: String

• data: LocalDate

• location: ManyToOne Location

• partecipanti: OneToMany Partecipante

Partecipante

• id: Long

• nome, cognome, email, dataDiNascita

• evento: ManyToOne Evento

Location

• id: Long

• nome: String

città: String

• eventi: OneToMany Evento

Evento.java

```
@Entity
@Data
@NoArgsConstructor
@AllArgsConstructor
@Builder
public class Evento {
    @Id
```

```
@GeneratedValue(strategy = GenerationType.IDENTITY)
private Long id;

@NotBlank
private String nome;

@Future
private LocalDate data;

@ManyToOne
@JoinColumn(name = "location_id")
private Location location;

@OneToMany(mappedBy = "evento")
private List<Partecipante> partecipanti;
}
```

Partecipante.java

```
@Entity
@Data
@NoArgsConstructor
@AllArgsConstructor
@Builder
public class Partecipante {
    @Id
    @GeneratedValue(strategy = GenerationType.IDENTITY)
    private Long id;

    @NotBlank
    private String nome;

@NotBlank
    private String cognome;
```

```
@Email
@NotBlank
private String email;

@Past
private LocalDate dataDiNascita;

@ManyToOne
@JoinColumn(name = "evento_id")
private Evento evento;
```

Location.java

```
@Entity
@Data
@NoArgsConstructor
@AllArgsConstructor
@Builder
public class Location {
    @Id
    @GeneratedValue(strategy = GenerationType.IDENTITY)
    private Long id;

    @NotBlank
    private String nome;

@NotBlank
private String città;

@OneToMany(mappedBy = "location")
```

```
private List<Evento> eventi;
}
```

DTO Request e Response

EventoRequest.java

```
@Data
public class EventoRequest {
    @NotBlank
    private String nome;

    @Future
    private LocalDate data;

    @NotNull
    private Long locationId;
}
```

EventoResponse.java

```
@Data
public class EventoResponse {
    private Long id;
    private String nome;
    private LocalDate data;
    private String locationNome;
    private String locationCittà;
}
```

PartecipanteRequest.java

```
@Data
public class PartecipanteRequest {
    @NotBlank
    private String nome;

    @NotBlank
    private String cognome;

    @Email
    @NotBlank
    private String email;

    @Past
    private LocalDate dataDiNascita;

    @NotNull
    private Long eventoId;
}
```

PartecipanteResponse.java

```
@Data
public class PartecipanteResponse {
    private Long id;
    private String nome;
    private String cognome;
    private String email;
    private LocalDate dataDiNascita;
    private String eventoNome;
}
```

LocationRequest.java

```
@Data
public class LocationRequest {
    @NotBlank
    private String nome;

    @NotBlank
    private String città;
}
```

LocationResponse.java

```
@Data
public class LocationResponse {

       pReg.setDataDiNascita(LocalDate
        now()
        .minusYears(faker.number().numberBetween(18, 50)));
       pReq.setEvento(eventi.get(faker.random().nextInt(eventi.size())));
       partecipanteService.create(pReq);
    }
```

```
}
```

Controller

EventoController.java

```
@RestController
@RequestMapping("/eventi")
public class EventoController {

    @Autowired
    private EventoService service;

    @GetMapping
    public List<EventoResponse> getAll() {
        return service.getAll();
    }

    @PostMapping
    public ResponseEntity<EventoResponse> create(@RequestBody EventoRequest request) {
        EventoResponse response = service.create(request);
        return new ResponseEntity<>(response, HttpStatus.CREATED);
    }
}
```

PartecipanteController.java

```
@RestController
@RequestMapping("/partecipanti")
public class PartecipanteController {
```

```
@Autowired
private PartecipanteService service;

@GetMapping
public List<PartecipanteResponse> getAll() {
    return service.getAll();
}

@PostMapping
public ResponseEntity<PartecipanteResponse> create(@RequestBody PartecipanteRequest request) {
    PartecipanteResponse response = service.create(request);
    return new ResponseEntity<>(response, HttpStatus.CREATED);
}
```

LocationController.java

```
@RestController
@RequestMapping("/location")
public class LocationController {

    @Autowired
    private LocationService service;

    @GetMapping
    public List<LocationResponse> getAll() {
        return service.getAll();
    }

    @PostMapping
    public ResponseEntity<LocationResponse> create(@RequestBody LocationRequest request) {
        LocationResponse response = service.create(request);
        return new ResponseEntity<>(response, HttpStatus.CREATED);
```

```
}
```

Validazioni

| Annotazione | Descrizione | Esempio |
|-----------------|---|--|
| @DecimalMax | Valore massimo per un numero decimale | @DecimalMax("100.00") private BigDecimal sconto; |
| @DecimalMin | Valore minimo per un numero decimale | @DecimalMin("10.00") private BigDecimal prezzo; |
| @Digits | Definisce numero massimo di cifre intere e decimali | <pre>@Digits(integer=3, fraction=2) private BigDecimal costo;</pre> |
| @Negative | Valore numerico negativo | @Negative private int perdita; |
| @NegativeOrZero | Valore <= 0 | @NegativeOrZero private int debito; |
| @Positive | Valore numerico positivo | @Positive private int guadagno; |
| @PositiveOrZero | Valore >= 0 | @PositiveOrZero private int saldo; |
| @Pattern | Valore deve rispettare una regex | <pre>@Pattern(regexp="^[A-Z]{3}[0-9]{3}\$") private String codice;</pre> |
| @NotNull | Il valore non può essere null | @NotNull private Long id; |
| @NotBlank | Il campo non può essere vuoto o solo spazi | @NotBlank private String nome; |
| @NotEmpty | Il campo non può essere una stringa vuota | @NotEmpty private String codice; |
| @Size | Definisce la lunghezza minima e massima | @Size(min=3, max=50) |
| @Min | Il numero deve essere >= al valore specificato | @Min(18) private int età; |

| Annotazione | Descrizione | Esempio |
|------------------|--|--|
| @Max | Il numero deve essere <= al valore specificato | @Max(65) private int età; |
| @Email | Il valore deve avere un formato email valido | @Email private String email; |
| @Past | La data deve essere nel passato | @Past private LocalDate nascita; |
| @PastOrPresent | La data può essere passata o odierna | @PastOrPresent private LocalDate data; |
| @Future | La data deve essere nel futuro | @Future private LocalDate evento; |
| @FutureOrPresent | La data può essere futura o odierna | @FutureOrPresent private LocalDate e; |
